Zone: 3-8

Color: White, pink, purple

Bloom Time: June through August

Plant Type: Perennial herb

Mature Height: 2-6' tall

Mature Spread: 2-3' wide

Water Use: Medium

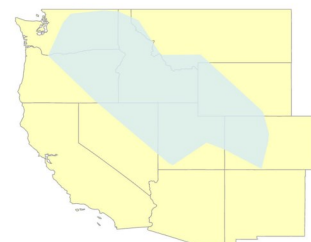

Soil Type: Chalk, clay, loam, and sand

Range and Native Habitat: Wild hollyhock grows throughout western U.S. with the exception of California, Arizona, and New Mexico. It grows in moist soils in open forests, meadows, and disturbed areas between 7,000 and 11,000 feet in elevation.

Suggested Maintenance: Wild hollyhock requires moist, well-drained soils. It should be placed in an area with ample space and along the backside of the garden bed, as the plant can become bushy and tall.

Other: The species name, *rivularis*, refers to the plant's preference for stream banks. The seeds need a heat treatment, such as full sun, and/or scarification to germinate. Wild hollyhock readily establishes after a wild-fire but can be quickly overtaken by other vegetation.

Distribution Map

Wildlife Supported

Landscaping Information

Sun
Full sun to part shade

Water Needs
Medium

Summer Irrigation
Max 4x / month once established

Soil Drainage
Well-drained

Propagation
By seed, heat treated and or scarification
